THE TERMINAL STABILIZATION OF CAPITAL: Eradicating Managerial Fragility via Evolutionary and Genetic Castification

Abstract Proposal for Strategic Review
Classification: Theoretical Socio-Biological Modeling / Transhumanist Governance
Target Matrix: Evolutionary Fiduciaries, Technocratic Sovereigns, and Biopolitical Capitalists

I. The Thesis of Managerial Fatalism (Why Paper Systems Fail)

Current global governance operates on an unsustainable paradigm of managerial mitigation (*idare etme*) rather than absolute systemic regulation (*yönetmek*). The contemporary ruling class relies on "paper and pixel" artifice—including fiat currency frameworks, legal-ideological apparatuses, and costly social-welfare concessions (as observed in the fragile, high-maintenance European social-democratic models).

Because these artificial constraints do not rely on immutable biological foundations, they are structurally condemned to entropic decay. The survival of an ideological "left" and chronic systemic friction across generations proves that ideological conditioning fails to permanently pacify human populations. True systemic immortality requires replacing fragile legalistic compliance with permanent genetic alignment.

II. The Tri-Aisles of Genomic Regulation (The Costless Architecture)

To eliminate the astronomical overhead costs of social stabilization, domestic policing, and ideological maintenance, we propose a three-tiered germline genetic therapy protocol implemented at the embryonic stage:

- **Oxytocin Receptor (OXTR) Gene Silencing (Eradication of Collective Mobilization):** By structurally suppressing the neurobiological pathways governing collective empathy, mutual trust, and tribal bonding, the biological capacity for solidarity is permanently disabled. This atomizes the populace at a cellular level, rendering labor unions, political resistance, and ideological uprisings biologically impossible.
- **Desynchronization of Evolutionary Mate Selection (De-Physicalization of Hypergamy):** The natural genetic markers regulating traditional physical and phenotypic hypergamic attraction are chemically decoupled. Biological sexual selection is rendered inert, neutralizing chaotic primordial impulses that defy institutional tracking.
- **Synthetic Endorsement of Hypergamy to Digital Capital:** The extracted hypergamic drive is synthetically re-indexed to trigger dopamine and serotonin release exclusively in response to institutional credit scores, digital asset accumulation, and compliance metrics.

III. The Infinite Multiplier: Compounded Consumption and Total Compliance

Contradicting traditional assumptions that a pacified caste decreases economic velocity, this biological reconfiguration guarantees a geometric expansion of market competition:

• **The Existential Void:** Stripped of organic human connections (due to OXTR silencing), the individual enters a state of absolute, profound existential isolation.

• **The Survival Imperative:** Because mating and evolutionary survival are genetically hardcoded to financial metrics, the pursuit of digital capital ceases to be a social choice and becomes a biological survival reflex.

• **The Outcome:** A hyper-competitive, endlessly productive, and self-motivating labor/consumer force that requires zero public funding, zero state welfare, and zero ideological coercion. Compliance is no longer enforced by the state; it is driven by the cellular biology of the subject.
